

Assignment 2 (20 marks)

Adding CSS to web pages

*****Remember for each assignment create a separate project on Firebase (this means a separate local folder also)*****

Adding CSS to style the applications

In this assignment we will create a landing page for a SaaS business

Home page (index.html)

1. Add a stylesheets folder to your public folder in your application directory and place a stylesheet in there called **style.css** to contain your styles (CSS). You must use a class-based selector when applying the styles below.
 - The page should contain a simple navigation bar at the top of it. Use a single div tag and place three separate links within it, Home, Pricing and About Us. Right align the div tag, by applying an appropriate CSS class. You do not need to use the <nav> tag for this.
 - Restyle the links from their browser defaults and alter their colour to any colour you like (preferably one which suits your page style).
 - The links should be anchor tags (<a> link tags) but instead of the href attribute containing a URL, it should point to a section on the page and scroll to that section on click. Tip: If you provide the page section tag with an id (id="home") and then use href="#home" on a link, it will jump that section when the user clicks on the link.
2. The home section of the page should be split in two and contain high level information about the SaaS company on the left hand side and an image of the offices on the right. The info about the company should only be 2-3 lines (you can make it up). Find a creative commons licensed image from the web of an office for the image of the office.
 - For the office image apply a **border-radius** style to create a "circled" image. Please define a separate CSS class for this.
3. The pricing section should contain two columns containing two separate offerings, a paid offer which costs €9 per month and a free offer. Please put the price at the top of the each offer and create an unordered list of bullet points underneath the price, outlining the features supported with a tick beside those that are available on the free version and an x for those that are not. You can make up these features. The paid version should support all features and thus contains all ticks.
4. The about us section should contain a more detailed description about the company.
5. Some marks will be awarded for aesthetics, so please make sure that it looks good!

Submission Instructions:

- 1) On Blackboard you can enter in the URL of your web page deployed on Firebase.
